

Claims

1. A process for driving a prime mover, said process
5 comprising
- a) positioning a selective membrane between a liquid and a solution having a higher osmotic potential than the liquid, such that the solution becomes pressurised by the influx of liquid across the membrane,
 - 10 b) using the pressure generated in the solution to drive a prime mover,
 - c) recovering the solution,
 - d) separating at least some of the solvent from the solution to form a residual product, and
 - 15 e) recycling the separated solvent and/or the residual product of step d) to step a).
2. A process as claimed in claim 1, wherein the prime
20 mover is a rotary prime mover.
3. A process as claimed in claim 1 or 2, wherein the prime
mover forms part of a pressure exchange system.
4. A process as claimed in any one of the preceding
25 claims, wherein the solution is an aqueous solution.
5. A process as claimed in any one of the preceding
claims, wherein the solution is solution for a salt selected
from sodium chloride, potassium chloride, potassium nitrate,
30 magnesium sulfate, magnesium chloride, sodium sulfate,
calcium chloride, sodium carbonate, disodium
hydrogenphosphate and potassium alum.

6. A process as claimed in claim 4 wherein the aqueous solution is formed by dissolving ammonia and carbon dioxide in water.
- 5 7. A process as claimed in claim 6, which is an aqueous solution of ammonia, carbon dioxide, ammonium carbonate, ammonium bicarbonate and ammonium carbamates.
8. A process as claimed in any one of the preceding
10 claims, wherein the solution has a solute concentration of 1 to 400 weight %.
9. A process as claimed in any one of the preceding
15 claims, wherein the liquid is selected from the group consisting of freshwater, seawater, brackish water and a waste stream from an industrial or agricultural process.
10. A process as claimed in any one of the preceding
20 claims, wherein the liquid is or comprises the same solvent as the solvent of the solution.
11. A process as claimed in any one of the preceding
25 claims, wherein solvent is removed in step d) by a thermal and/or membrane separation method.
12. A process as claimed in claim 11, wherein the solvent is removed using a method selected from evaporation, distillation and crystallization.
- 30 13. A process as claimed in claim 12, wherein the solvent is removed by at least one method selected from multi-stage

flash distillation, multi-effect distillation, mechanical vapour compression and rapid spray desalination.

14. A process as claimed in claim 11, wherein the solvent
5 is removed by at least one method selected from ion-exchange, electrodialysis nanofiltration and osmosis.

15. A process as claimed in any one of the preceding claims, wherein the energy required to remove solvent in
10 step d) is provided by the wind power, thermal energy of the surrounding environment, solar energy, geothermal energy, energy from a biological process, energy from the combustion of fuel and/or excess heat from power plants and other industrial processes.

15

16. A process as claimed in any one of the preceding claims, wherein at least some of the solvent recovered in
step d) is recycled to a liquid for step a).

20 17. A process as claimed in any one of the preceding claims, which comprises using the pressure generated in the solution to transfer the solution to an elevated location, and using the potential energy of the elevated solution to drive the prime mover.

25

18. An apparatus for driving a prime mover, said apparatus comprising

a prime mover,

a housing comprising a selective membrane for

30 separating a liquid from a solution having a higher solute concentration than the liquid and configured such that

liquid passing through the membrane pressurises the solution,

means for transmitting the pressure generated in the solution to the prime mover,

5 means for recovering the solution,

means for separating solvent from the solution to produce a residual product, and

means for recycling the residual product and/or the separated solvent to the housing.
